

Performance Monitoring

Introduction

This document will guide you through the process of using Integrated Performance Monitoring on HPC Wales.

What is IPM?

Integrated Performance Monitoring (IPM) is a portable profiling infrastructure that provides a low-overhead framework for measuring the performance and resource utilization of parallel codes. It collects metrics about communication, computation and IO.

Further details on accessing HPC Wales systems can be found in the User Guide and help can be obtained through the Support Desk:

- E-mail
- support@hpcwales.co.uk
- Telephone 08452 572 207
- Website <u>https://hpcwprod.service-now.com/</u>

Profiling With IPM

You do not need to recompile your code to use IPM. Simply load the ipm module in your batch script and replace your line that calls mpirun with the following:

LD_PRELOAD=\$IPM_LD_PRELOAD mpirun [args] ./myexec

where [args] are the arguments you pass to mpirun and myexec is your executable.

IPM Output

IPM prints a report at the end of the output file from your job:

##I]	PMv0.983	#####	# # # # # # # # # # # #	############	############	* # # # # # # # # # # # # # # # # #	####

The report has three sections. The header provides general information such as total runtime and percentage of time spent on communication. The second section shows the variation across processes by reporting the average, minimum and maximum values of the observed timing data. The third section reports the number of calls for every MPI function used in the code and the total time spent in each.

There will also be an XML file in the same directory in which your job ran that will have a name of the form <user.name><user.name>.<numbers>.<numbers>.<numbers>.<This can be post-processed with the ipm_parse utility to give a detailed web-page view of IPM's output:

Ref: HPCW-AG-14-002

hpcwales.co.uk

IPM Output

ipm_parse -html <filename>

This will produce a directory containing some html pages that you can view in the browser of your choice. To do this, copy the files from HPC Wales to your local machine. The report will look like this:

IPM Output

Controlling the Level of Output

The level of detail that IPM reports is controlled by the IPM_REPORT environment variable.

Value	Description
terse	(default) Aggregate wallclock time, memory usage and flops are reported along with the percentage of wallclock time spent in MPI calls.
full	Each hardware counter is reported (where available) as are all of wallclock, user, system, and MPI time. The contribution of each MPI call to the communication time is given.
none	No report

Online Documentation

The <u>full IPM user guide</u> is available online.
